Realbread Rising - Giving life to your very own sourdough starter

Day 1

50g wholemeal flour
50g water
Place the flour and water into a clean bowl and stir together until fully combined. Cover and leave at room temperature overnight.

Day 2

75g wholemeal flour
75g water
To the sourdough starter add 75g wholemeal flour and 75g water. Stir together until fully combined. Cover and leave at room temperature overnight.

Day 3

Discard 100g of sourdough starter and add to it

100g water
100g wholemeal flour
Add the flour to the starter, and mix in the water. Cover and leave overnight.

Day 4

Discard 150g of sourdough starter and add to it

100g water
100g wholemeal flour
Add the flour to the starter, and mix in the water. Cover and leave overnight. The starter should start to smell pleasantly sour with small bubbles appearing on the surface.

Day 5

Discard 200g of sourdough starter and add to it

150g water
150g strong white flour
Add the flour to the starter, and mix in the water. Cover and leave overnight. The starter should appear active and full of bubbles.

Day 6

The starter should be quite active now and be full of little bubbles and smell slightly sour.

Discard 250g of sourdough starter and add to it:

- 200g water
- 200g strong white flour

Add the flour to the starter, and mix in the water. Cover and leave overnight.

Day 7

The starter should now be very active and full of bubbles. The starter is now ready to use.

Remember when making your sourdough bread always retain some sourdough starter which will be feed/refreshed ensuring you have some sourdough starter for the next dough.

Maintaining your sourdough starter

Your sourdough starter/culture is a bubbling living collection of friendly bacteria that will be used to make your dough rise. It is the natural yeast that will be used to make your sourdough bread.

Sourdough starter is best stored in a bowl or plastic container, something which can be covered. Make sure to allow room within the container for the sourdough starter to grow and rise.

To refresh or feed the sourdough starter

Whatever weight of sourdough starter you have add the same weight of flour and the same weight of water.

For example, 200g of sourdough starter add 200g of flour and 20g of water. Stir everything together.

If you have too much starter discard the excess and keep back what you need.

If the sourdough starter is stored at room temperature it will require to be refreshed/feed every day.

For the home baker when you might only bake once a week having to feed/refresh your sourdough starter everyday can become quite expensive.

Therefore, your starter can be stored in the fridge for up to 10 days and taken out when needed.

If using the starter from the fridge.

Take the starter out from the fridge the day before you plan to bake. This will allow the starter to come to room temperature. The night before you plan to bake refresh/feed your starter as per the instructions above. Leave the sourdough starter at room temperature overnight. The next morning the starter should be active and full of bubbles and ready to bake with.

Take what you need to make your dough. Feed the remaining starter and return it to the fridge.
